

Spatial Data Management using Spatial Databases

Yao-Yi Chiang

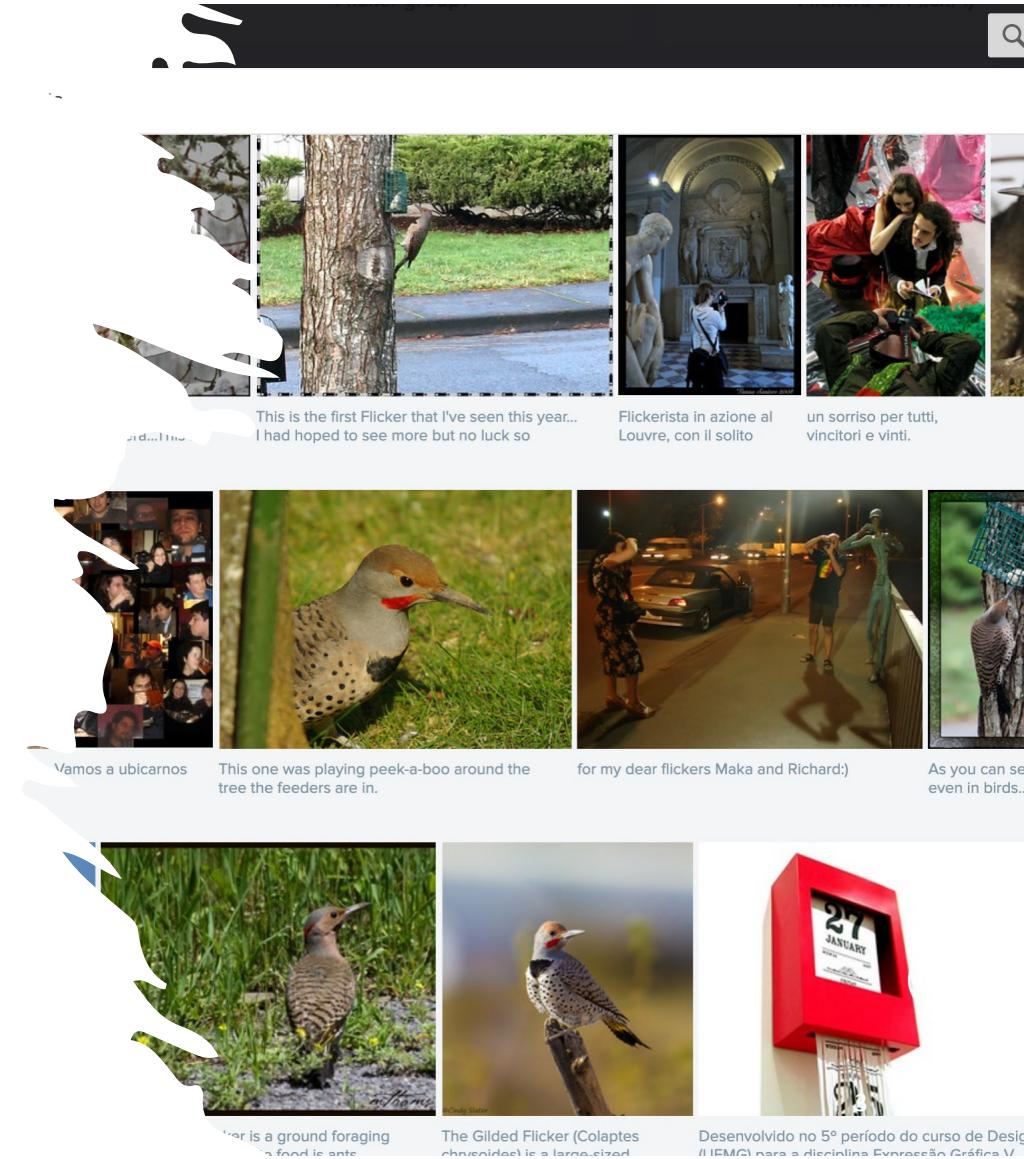

Computer Science and Engineering
University of Minnesota

yaoyi@umn.edu

What is Data Management?

How do you manage your photos?

- Most cellphones take nice photos
 - Taking 3 photos a day will give you ~1,000 photos a year
 - Taking a 5-day vacation would give you 200 photos
- Ways to managing photos
 - Leave them on the phone?
 - Organize them into folders?
 - Upload them to some cloud services?
- Which method is the best?

Considerations for Managing Photos

Find photos by time

Find photos by subjects

Find photos by locations

Searching must be fast!

Photos need to be secure

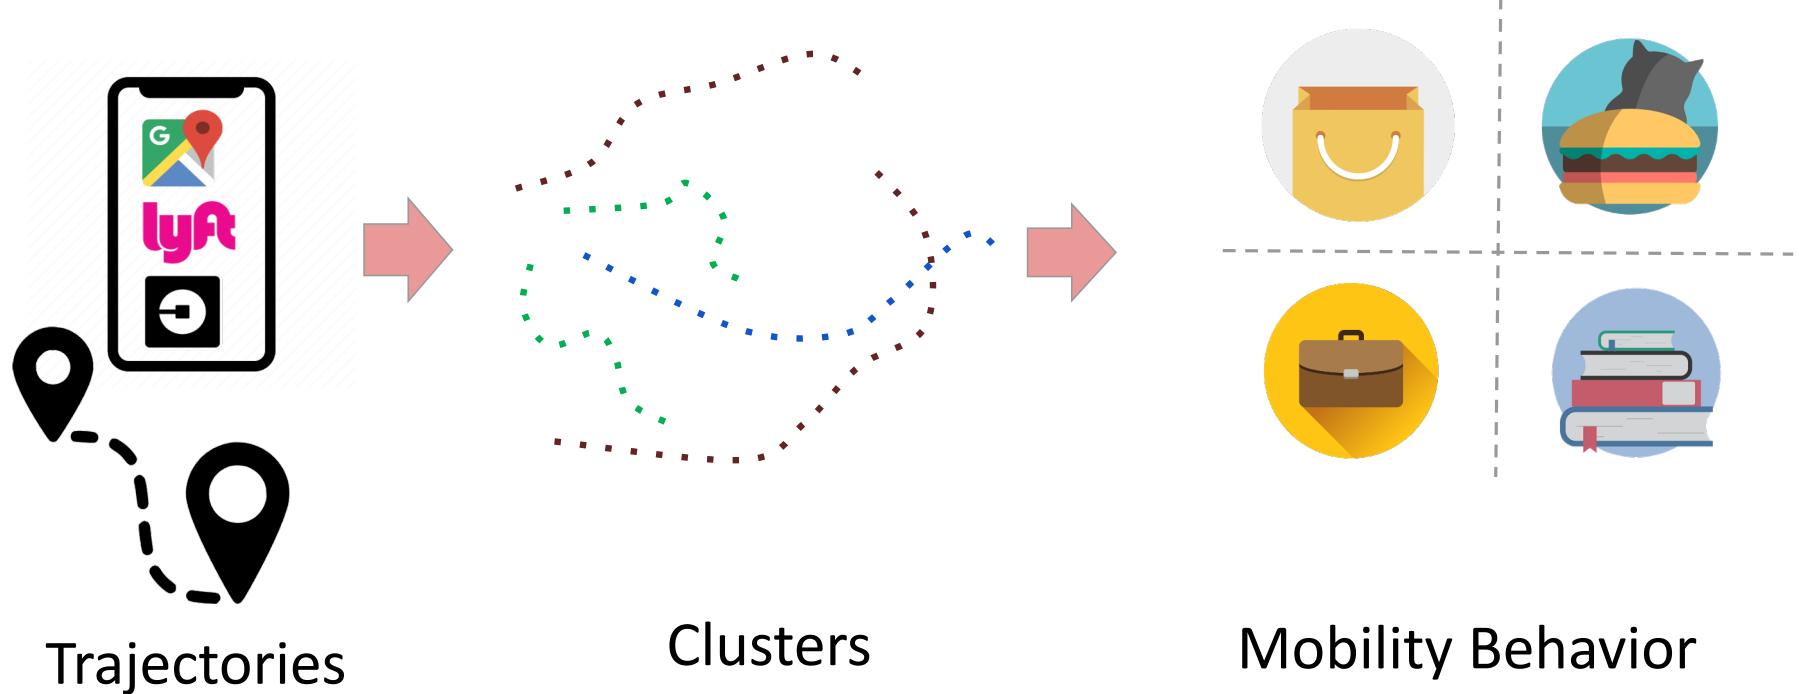

Available resources

Data Management (Oracle)

- Data management is the practice of **collecting, keeping, and using** data **securely, efficiently, and cost-effectively**.
- help people, organizations, and connected things
 - optimize the use of data within the bounds of policy and regulation
 - (use data to) make decisions and take actions that maximize the benefit to the organization

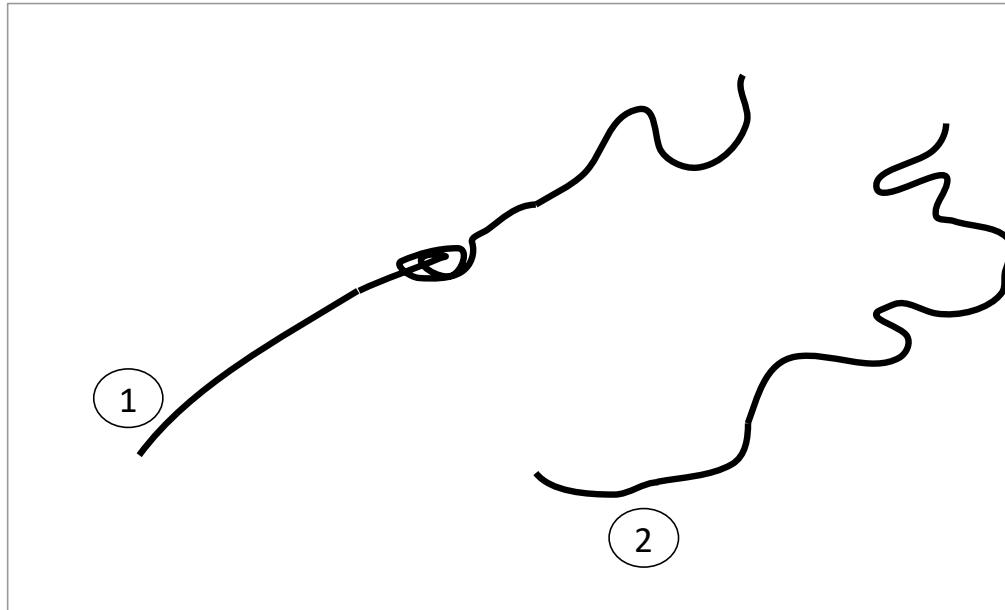

What are Some Data Use Cases for Spatial AI?

Trajectory Mining

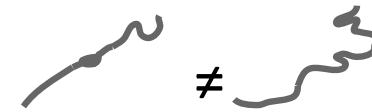

Yue, M., Li, Y., Yang, H., Ahuja, R., **Chiang, Y.-Y.**, and Shahabi, C. (December 2019). DETECT: Deep Trajectory Clustering for Mobility-Behavior Analysis. In *Proceedings of the 2019 IEEE International Conference on Big Data (Big Data)*, pp. 988–997, Los Angeles, CA, USA

Do these two trajectories have the same moving behavior?

Shapes ✗

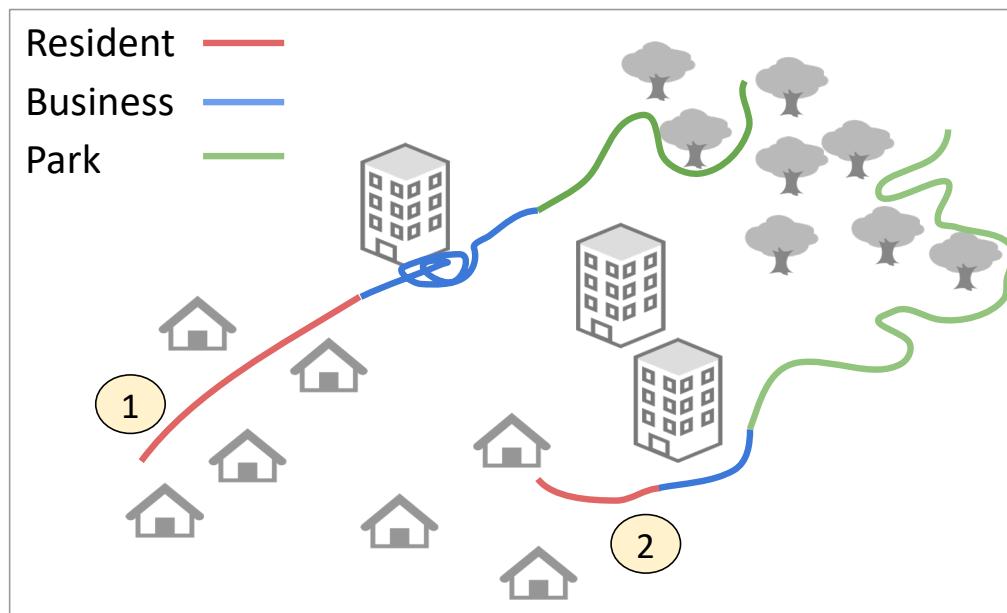

Distance ✗

With Geographical Context

Shapes ✕

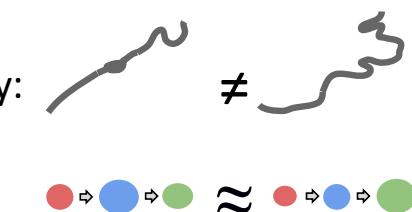

Distance ✕

Sequence of activities ✓

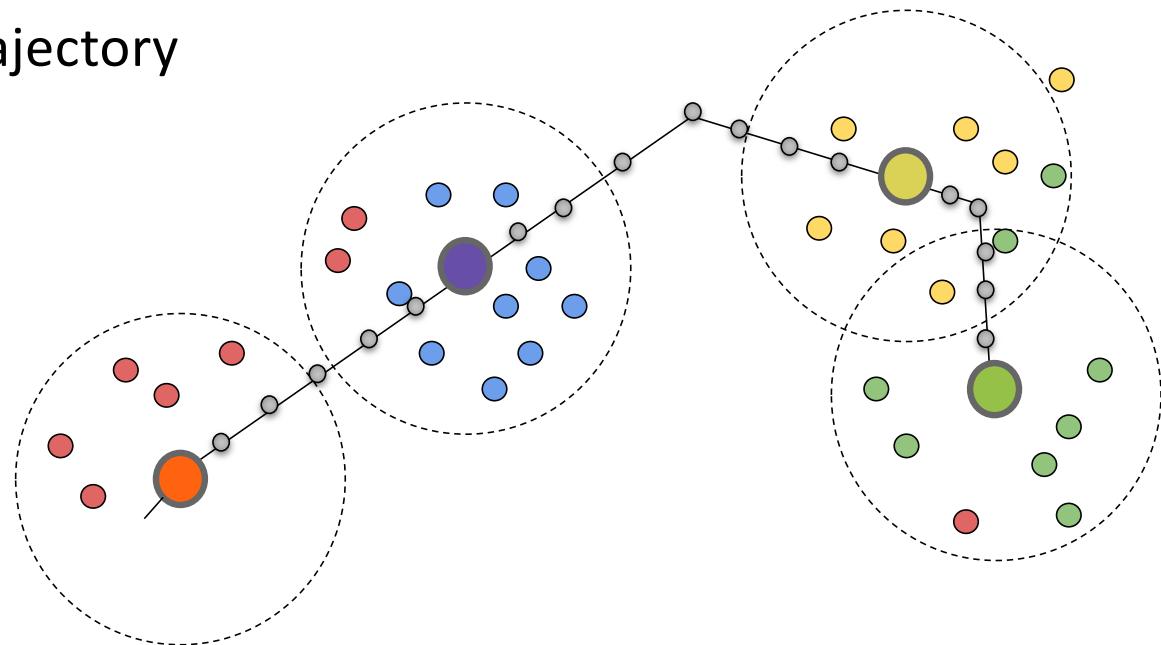

Raw Trajectory:

With Context:

Generate Geographic Context

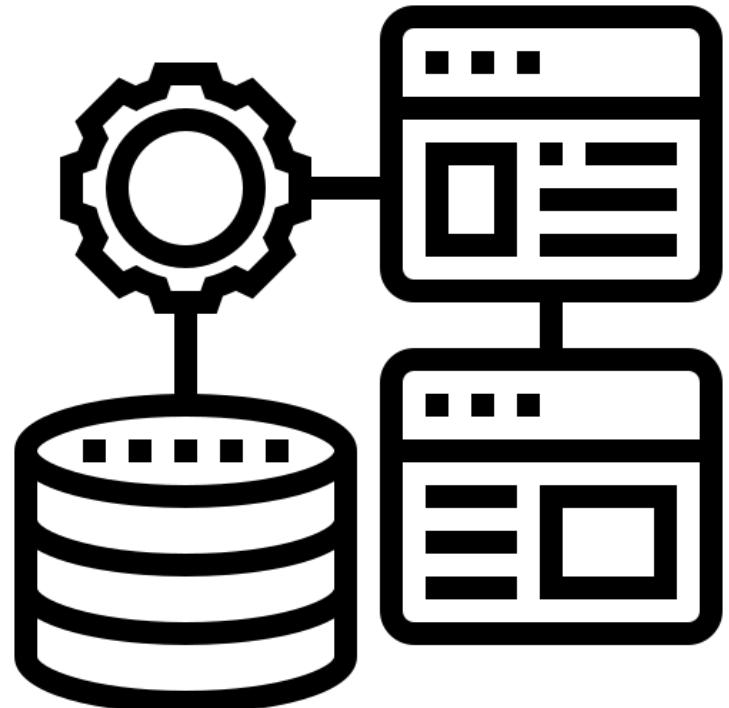

- Find nearby geographic features at each important location of a trajectory
- Distance query

Database Management System

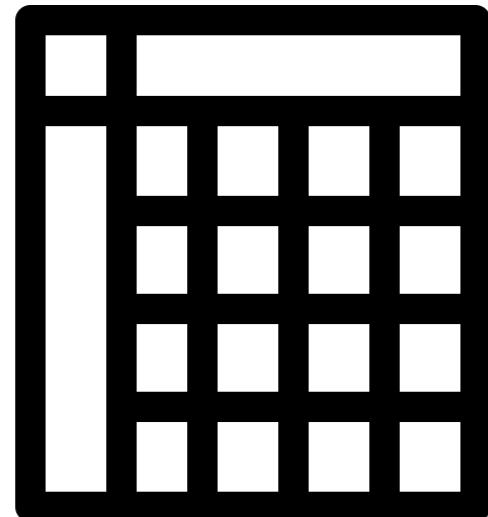

Database Management System (DBMS)

- **Persistence** across failures
 - maintain a consistent system after failures – software, hardware, network failures, etc.
- **Concurrent access** to data
- **Scalability** to search on very large datasets (which do not fit inside main memories of computers)
- **Efficiency**

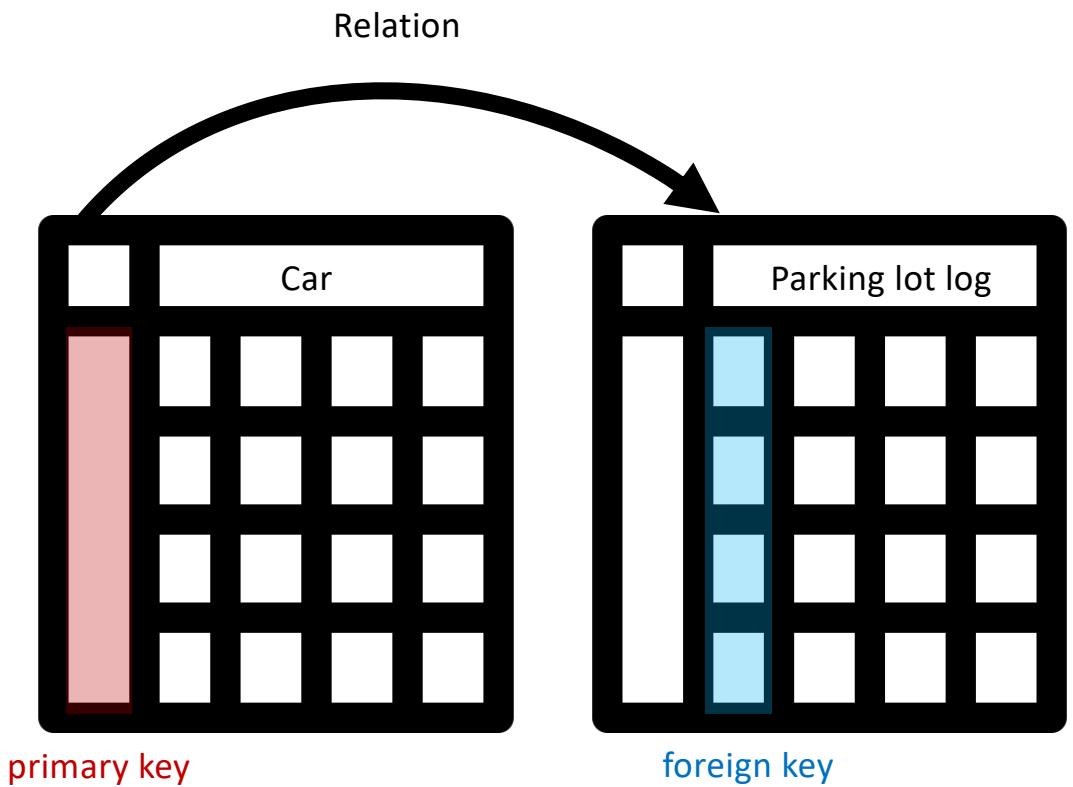

Tables in Relational DBMS

- A table describes the abstraction of a collection of **things**
 - e.g., cars, parking lot logs
- A table can contain many **columns** and many **rows**
- The table **schema** describes the **metadata** (columns) of these **things** (rows)
 - e.g., exist time
- Values in one column share the same abstract data types
 - e.g., integer, floating points

IDs and Relations

- Typically, one column, the **primary key**, contains the **unique ID** (identifier) of the described things
 - e.g., student IDs, social security numbers
- This primary key column can exist in other tables to establish a relation
 - the **foreign key**

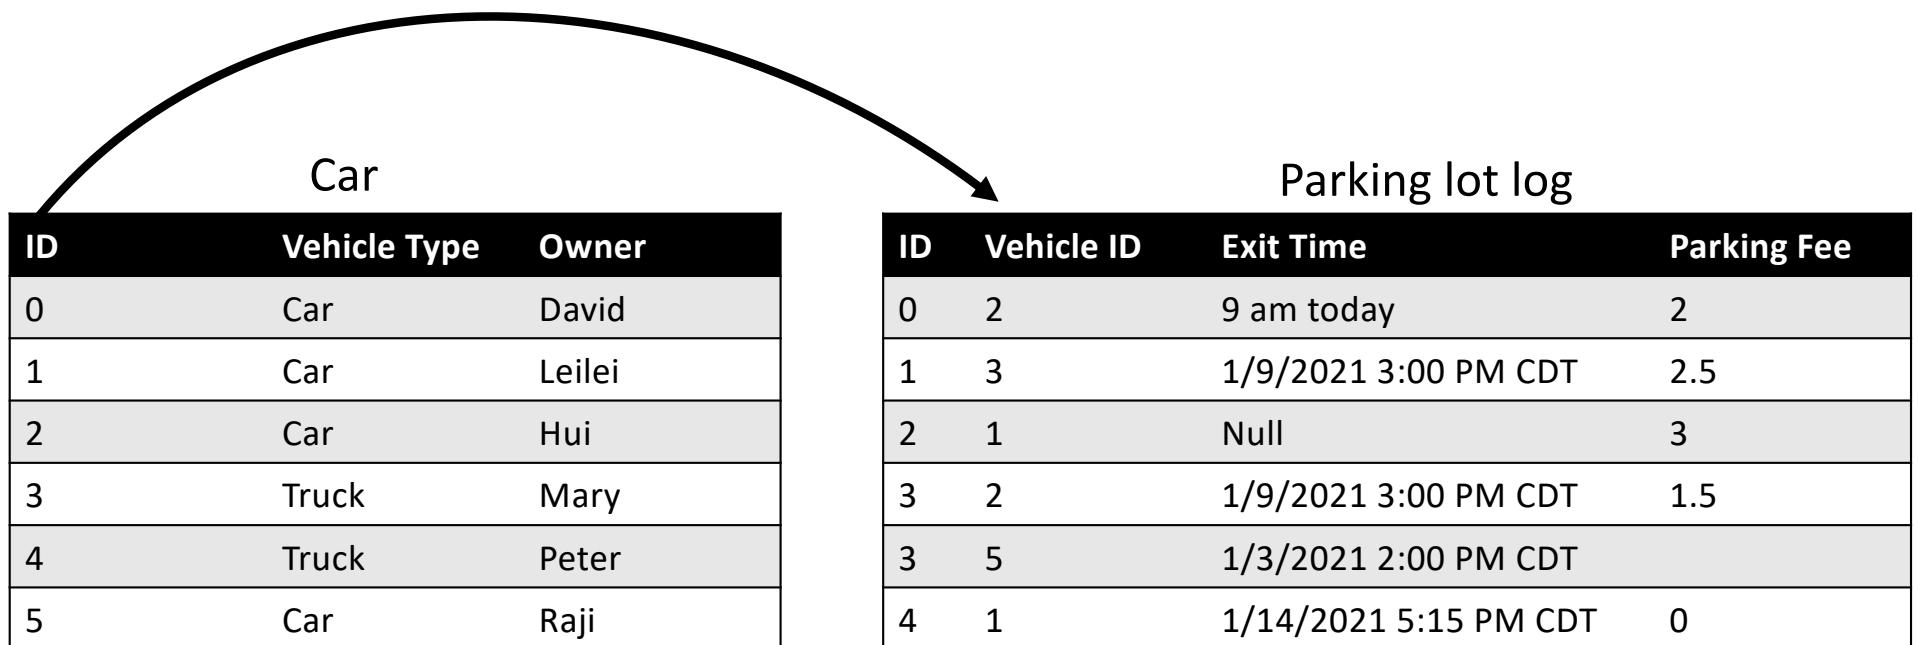

Common Abstract Data Types (ABT)

- Integers
 - 1, 5, -2, 9,...
- Floating points
 - 0.12, -1.33, 2.459,...
- Datetime
 - 11/27/1988 1:11 PM PDT
- String/Multi-characters
 - “Spatial AI is fun!”
- Customized Domains
 - “Vehicle”, “Car”, “Truck”

Parking lot log

| ID | Vehicle Type | Exit Time | Parking Fee |
|----|--------------|-----------------------|-------------|
| 0 | Car | 9 am today | 2 |
| 1 | Truck | 1/9/2021 3:00 PM CDT | 2.5 |
| 2 | Minivan | Null | 3 |
| 3 | Wagon | 1/9/2021 3:00 PM CDT | 1.5 |
| 3 | Car | 1/3/2021 2:00 PM CDT | |
| 4 | Small car | 1/14/2021 5:15 PM CDT | Did not pay |

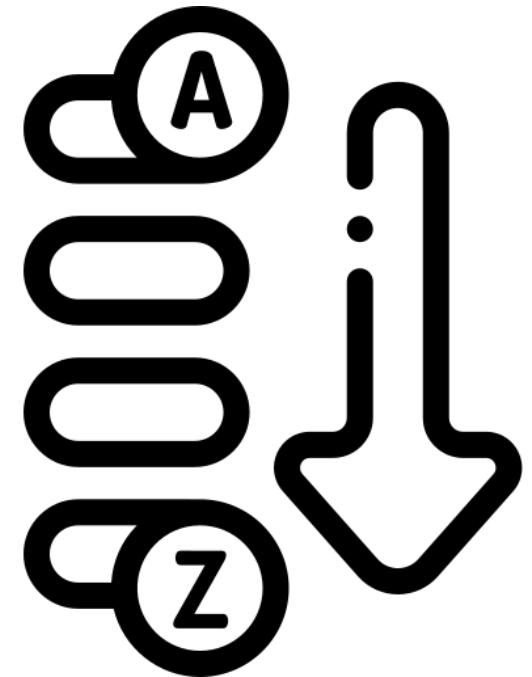

Maintain Data Integrity

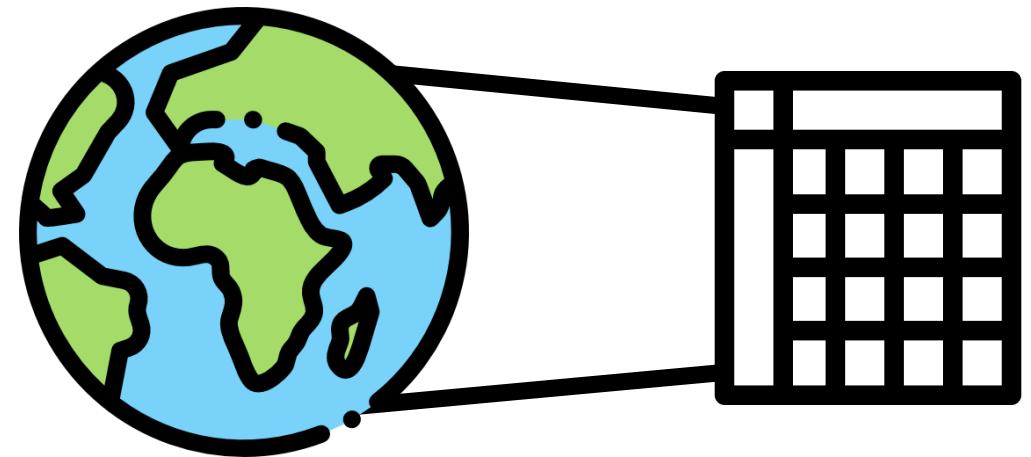

Also, take a look at database normalization on Wikipedia: https://en.wikipedia.org/wiki/Database_normalization

Index

- Take (machine) time to build
- Once built, help speed up data retrieval
- Example:
 - Say you have collected paper questionnaires from 100 randomly selected students
 - Now you need to find information for a specific student using their student ID
 - How do you speed up the process?

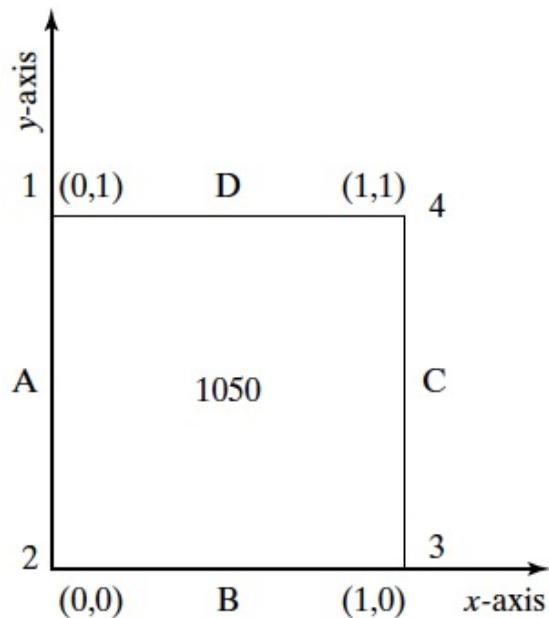

Spatial Data Management System

Model Spatial Data in Traditional DBMS

Use common ADTs, e.g., integer, string, floating points

Census_blocks

| Name | Area | Population | boundary-ID |
|------|------|------------|-------------|
| 340 | 1 | 1839 | 1050 |
| | | | |
| | | | |
| | | | |

Polygon

| boundary-ID | edge-name |
|-------------|-----------|
| 1050 | A |
| 1050 | B |
| 1050 | C |
| 1050 | D |

Edge

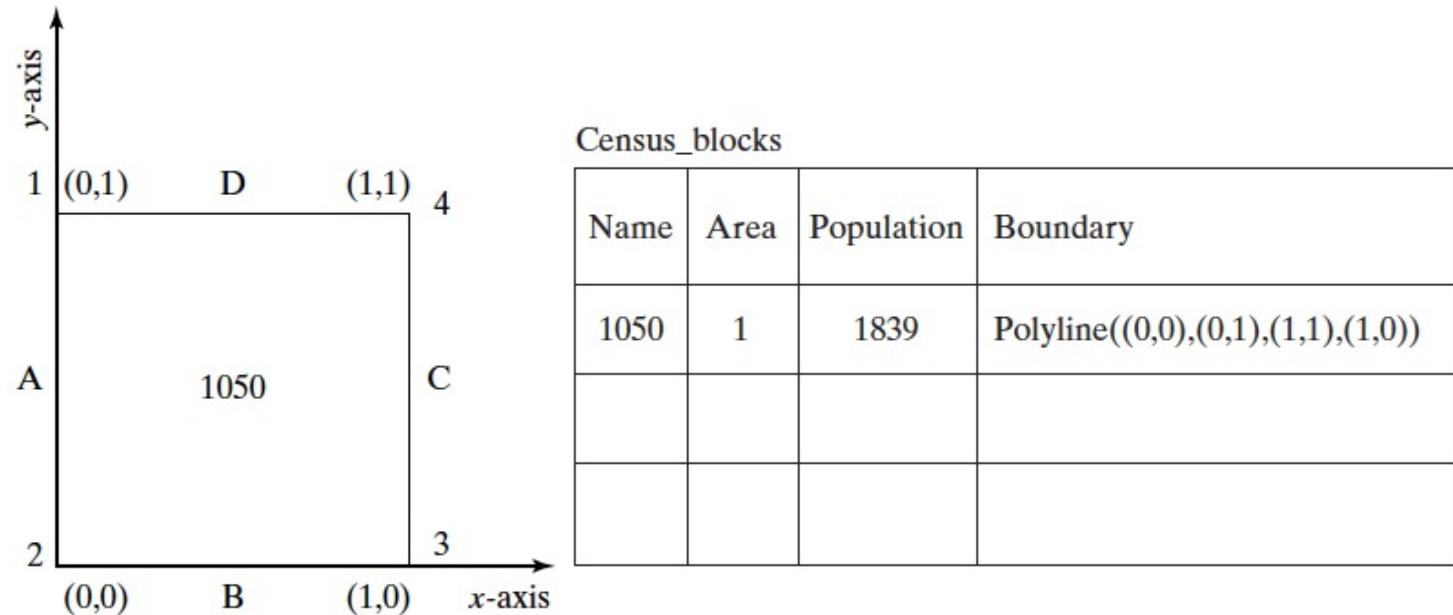

| edge-name | endpoint |
|-----------|----------|
| A | 1 |
| A | 2 |
| B | 2 |
| B | 3 |
| C | 3 |
| C | 4 |
| D | 4 |
| D | 1 |
| | |
| | |
| | |

Point

| endpoint | x-coor | y-coor |
|----------|--------|--------|
| 1 | 0 | 1 |
| 2 | 0 | 0 |
| 3 | 1 | 0 |
| 4 | 1 | 1 |
| | | |
| | | |
| | | |

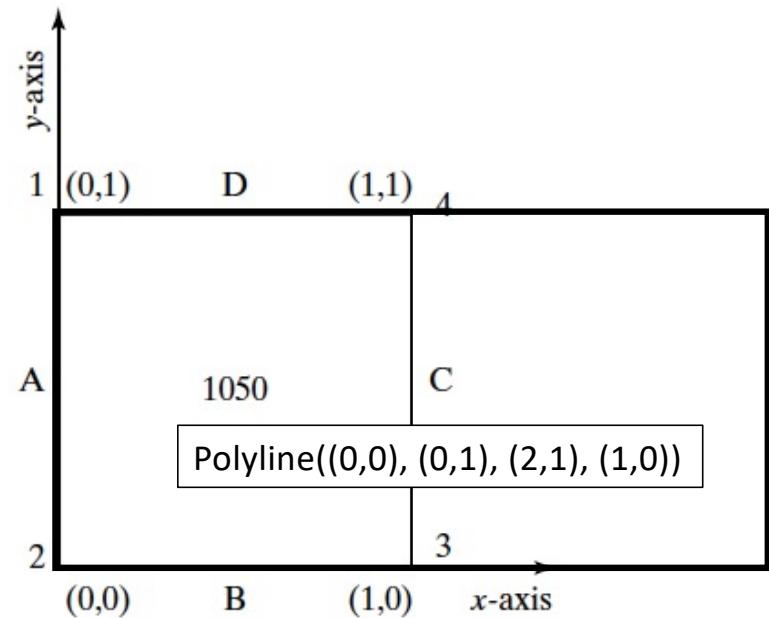

Model Spatial Data in Traditional DBMS

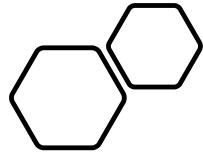

How about this? What is the data type of the boundary column? String?

Model Spatial Data in Traditional DBMS

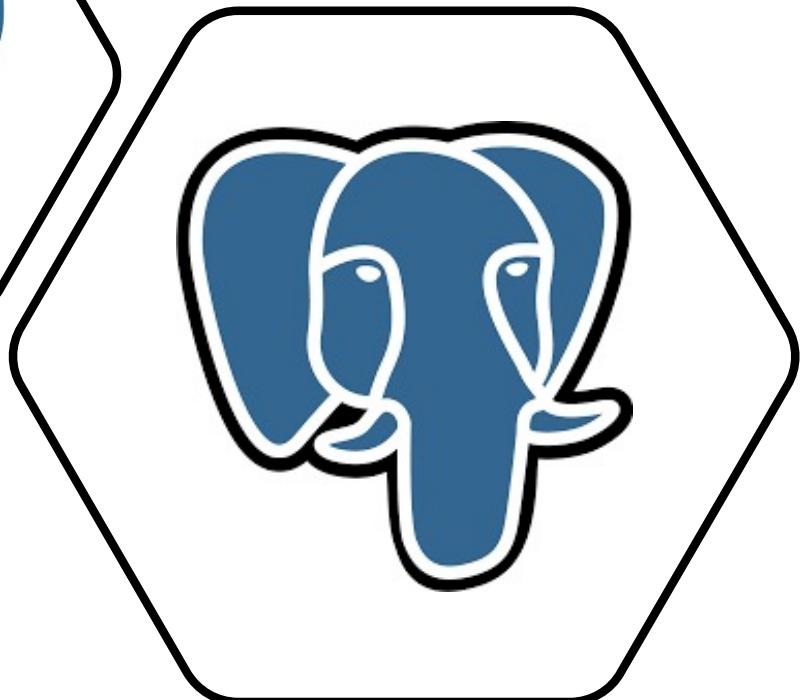

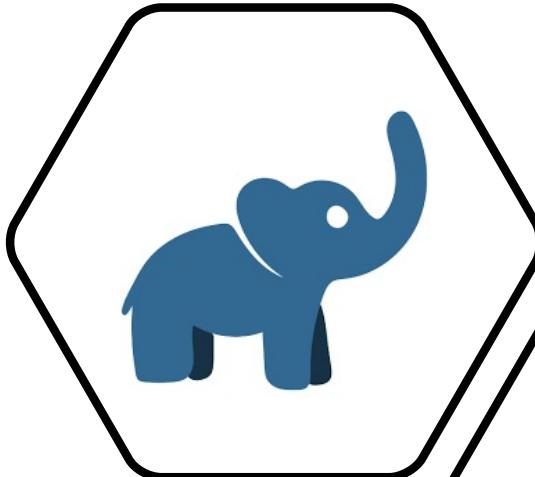

- Can we do
 - `Concat(Polyline((0,0), (0,1), (1,1), (1,0)), Polyline(1,0), (2,0), (2,1), (1,1))`
 - And get `Polyline((0,0), (0,1), (2,1), (1,0))`
- Or ask questions like
 - `Area_Size(Polyline((0,0), (0,1), (1,1), (1,0))) = ?`
 - And get 1
- We can't if the data type is String.

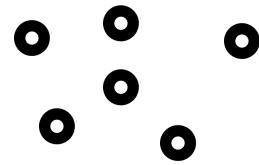

Spatial Data Models

- Spatial data models extends DBMS data models (i.e., requiring a DBMS engine)
- Provide rules to identify identifiable objects and properties of space
- Provide spatial data types at the atomic level, such as integer, string

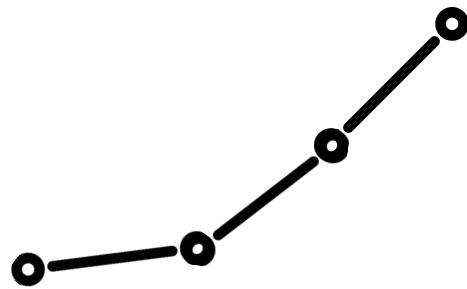

Spatial Data Vector Model

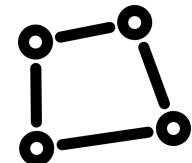

- **Vector** model: manage **identifiable things with clear boundaries (or discrete locations)**, e.g., hotels, mountain peaks, cities, land-parcels

Point

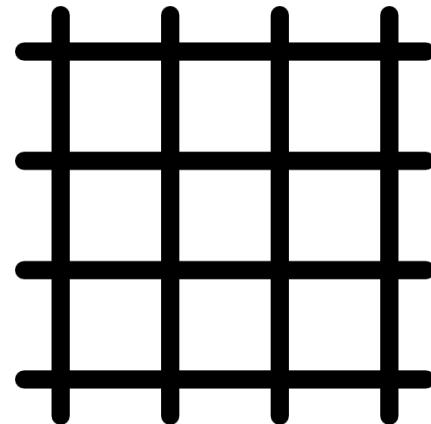

Line

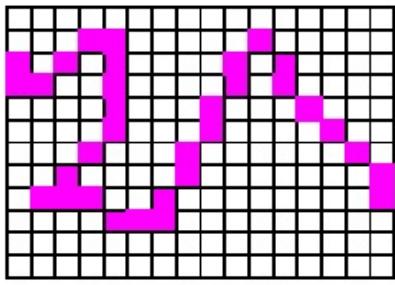

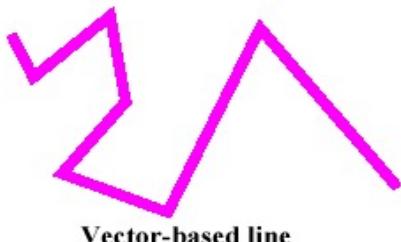

Polygon

Spatial Data Raster Model

- **Raster** model: manage **continuous and amorphous phenomenon**, e.g., wetlands, satellite imagery, snowfall

| Geometry primitives (2D) | | |
|--------------------------|----------|---|
| Type | Examples | |
| Point | | POINT (30 10) |
| LineString | | LINESTRING (30 10, 10 30, 40 40) |
| Polygon | | POLYGON ((30 10, 40 40, 20 40, 10 20, 30 10)) |
| | | POLYGON ((35 10, 45 45, 15 40, 10 20, 35 10), (20 30, 35 35, 30 20, 20 30)) |

Well-known text (WKT)

Support Common Spatial Data Operations

- Direction queries
 - What is the nearest restaurant north of my current location?
- Distance queries
 - What are the restaurants within a 1-mile radius
- Topology queries
 - How many restaurants within the Los Angeles city boundary?

Spatial Query in Practice

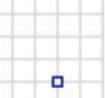

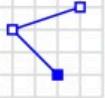

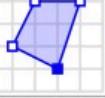

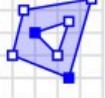

Credit: David Seidner

Spatial Coordinates and Reference Systems

How do we talk about locations on Earth?

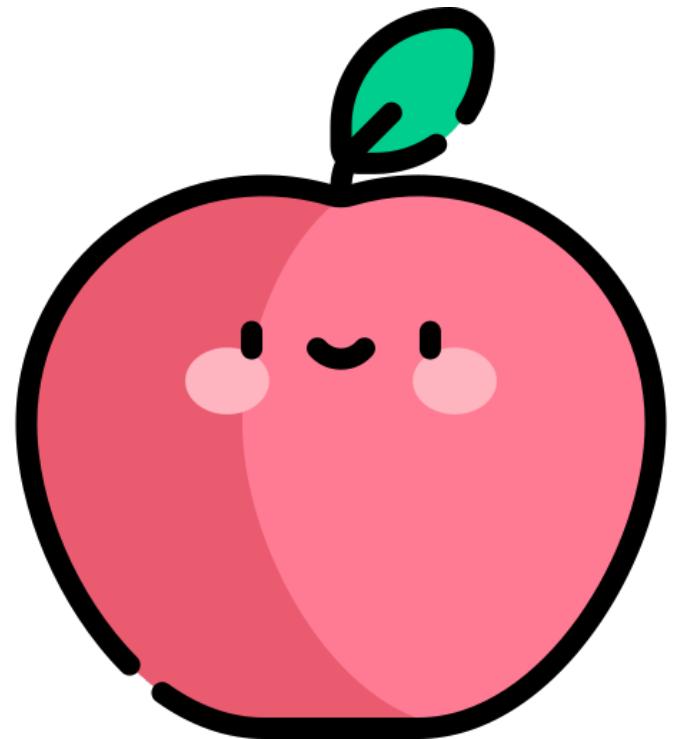

- What are these numbers?

| Geometry primitives (2D) | |
|--------------------------|---|
| Type | Examples |
| Point |  POINT (30 10) |
| LineString |  LINESTRING (30 10, 10 30, 40 40) |
| Polygon |  POLYGON ((30 10, 40 40, 20 40, 10 20, 30 10)) |
| |  POLYGON ((35 10, 45 45, 15 40, 10 20, 35 10), (20 30, 35 35, 30 20, 20 30)) |

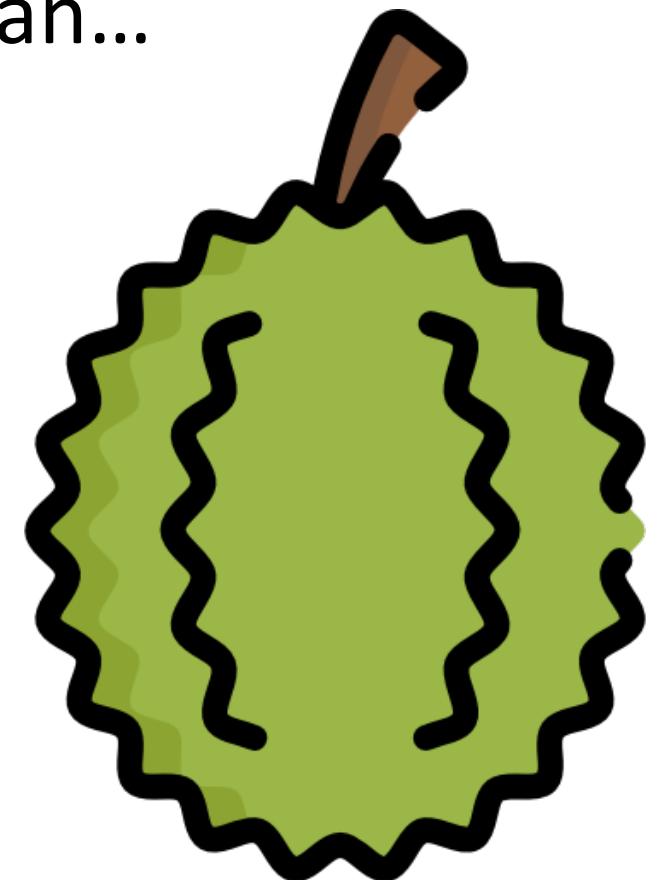

How do we talk about locations on an apple?

- Label each location on the apple an ID
 - e.g., location 1, location 2, location 3
 - Give the apple to other people and use the labels to talk about locations
- OR
- Pick an origin point (e.g., top of the apple)
 - Sequentially give each location a number based on its direction and distance to the origin point

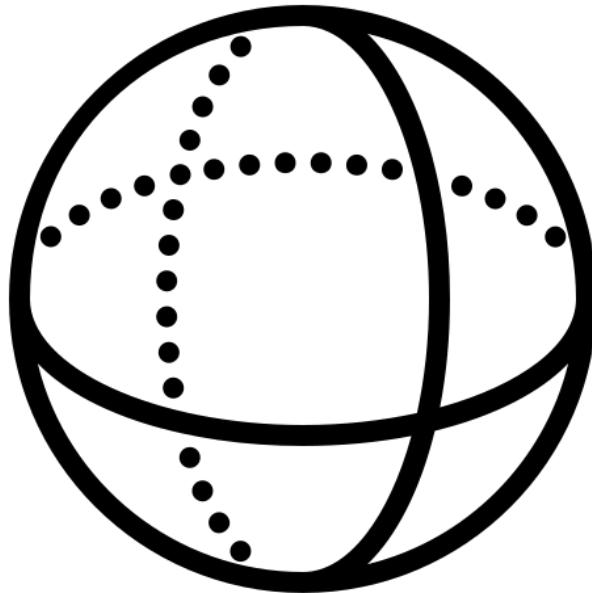

What if it's a durian...

- Also, we don't want to have to pass the durian to other people
- Build a 3D model of the durian, repeat what we did for the apple
 - not as smooth as an apple
 - the 3D model becomes very complicated
- Wait, what is a model again?

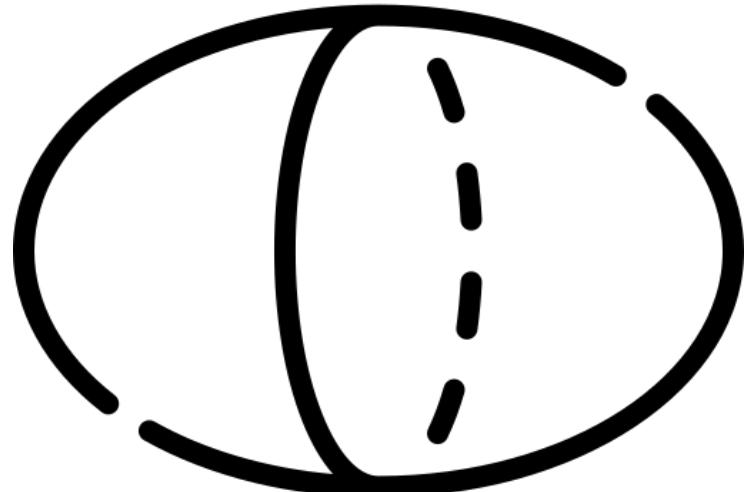

Sphere and Ellipsoid Models

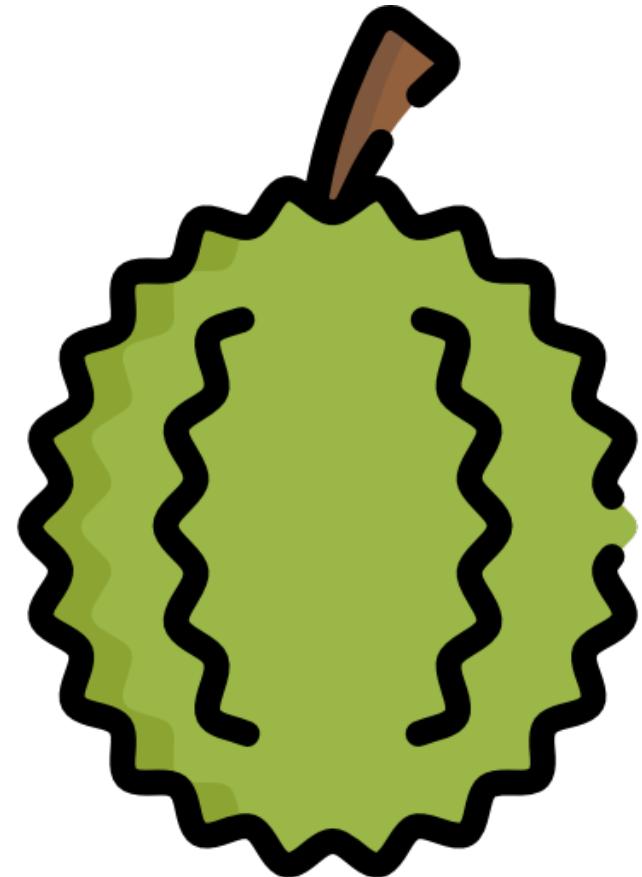

Sphere: one parameter (radius)

Ellipsoid: three parameters

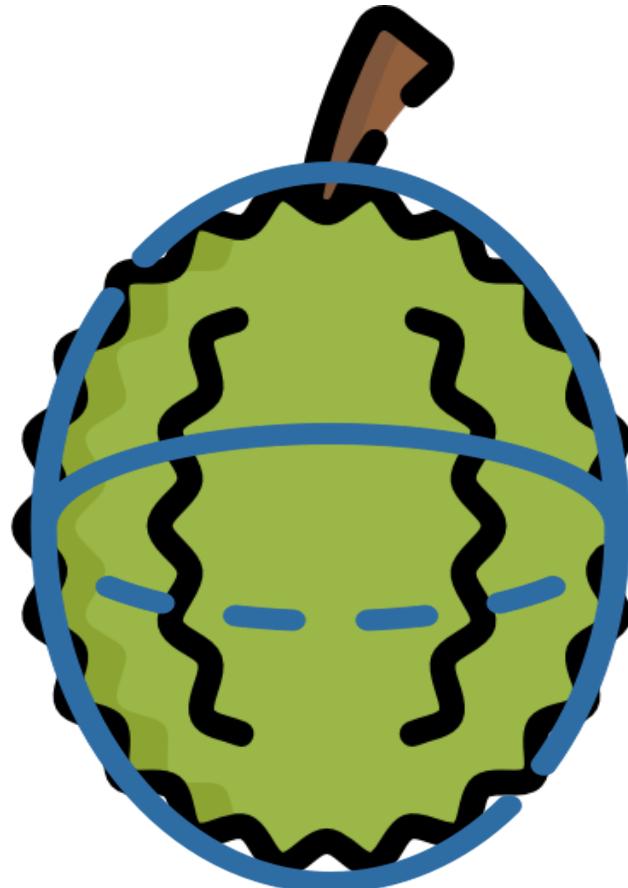

An ellipsoid model is easier to deal with than a durian...

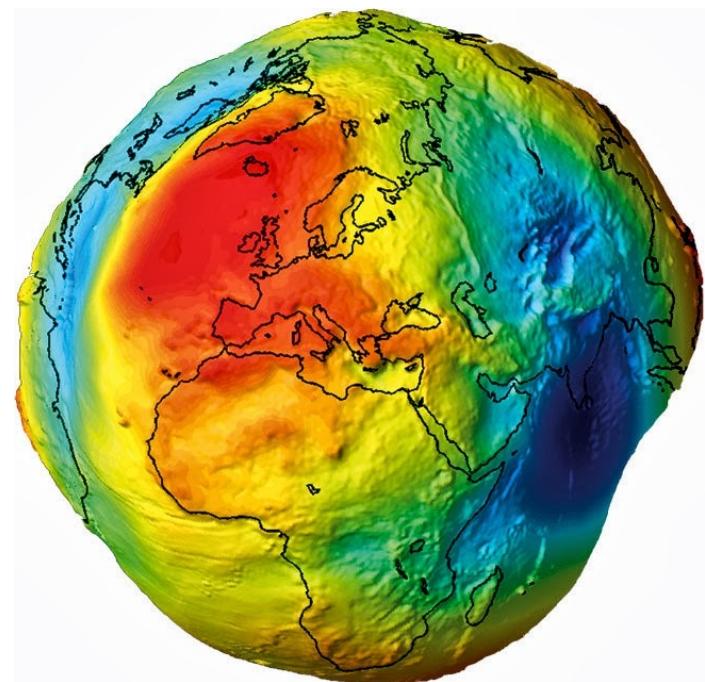

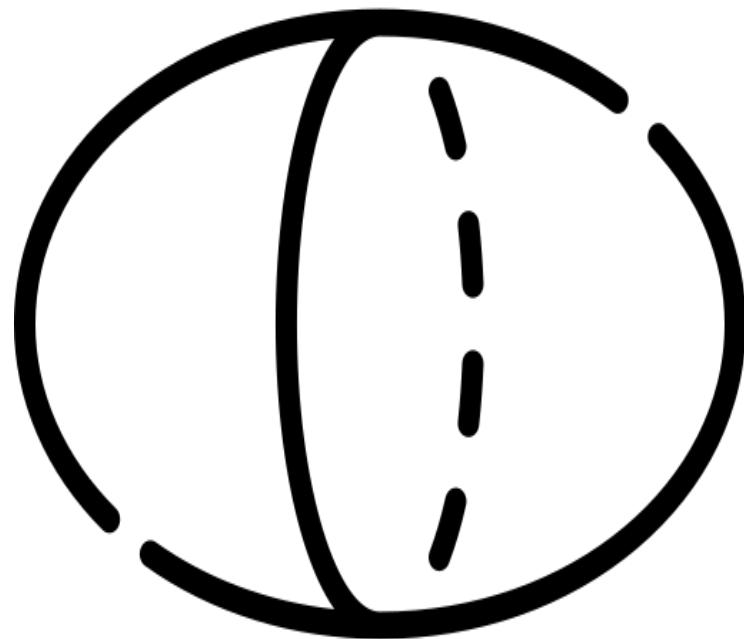

An ellipsoid model is easier to deal with than a durian...*

- Let's find the “best” sphere to approximate our durian
- Use the sphere to talk about locations on the durian

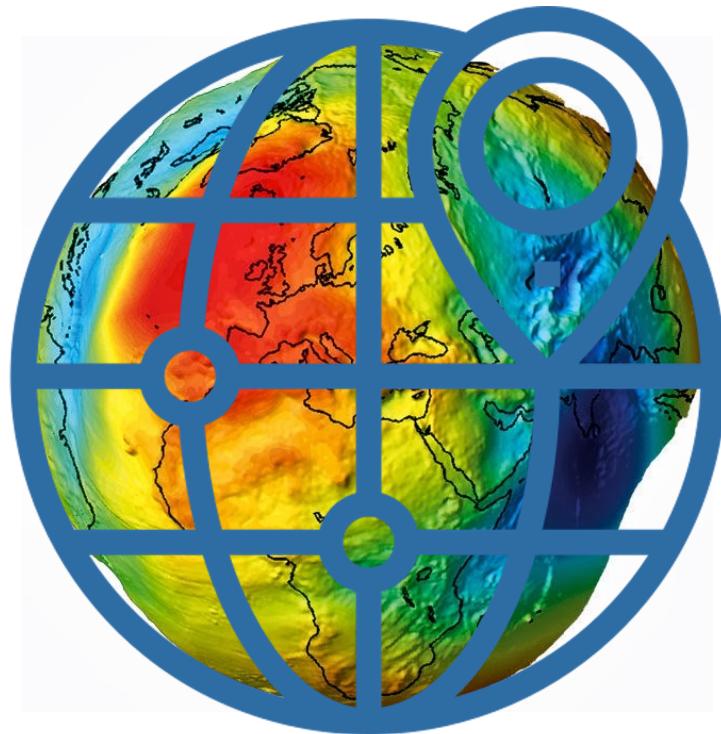

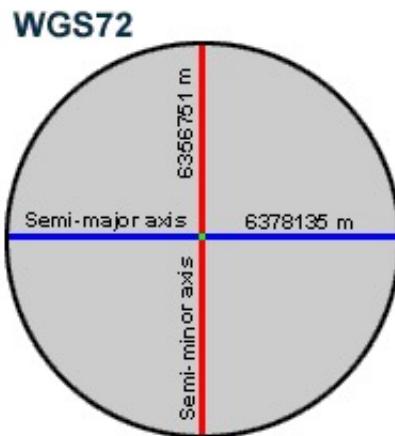

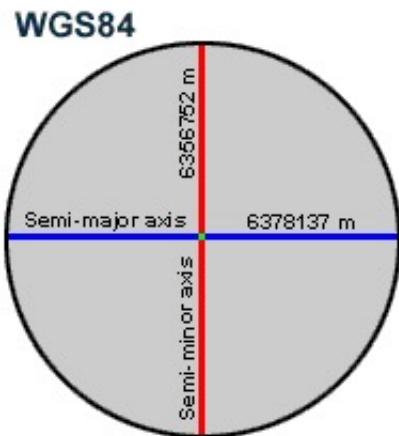

We can do the same for the Earth

Geoid: a math figure of the Earth

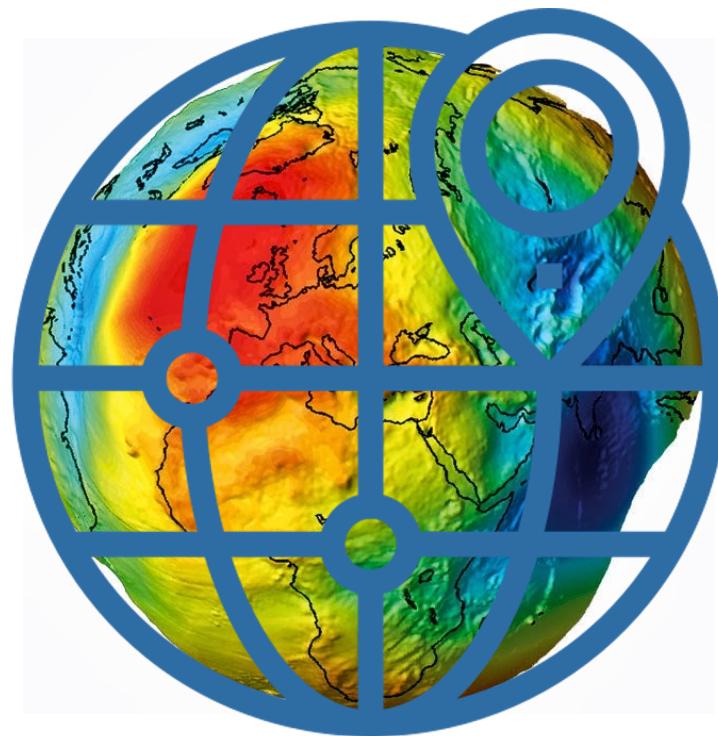

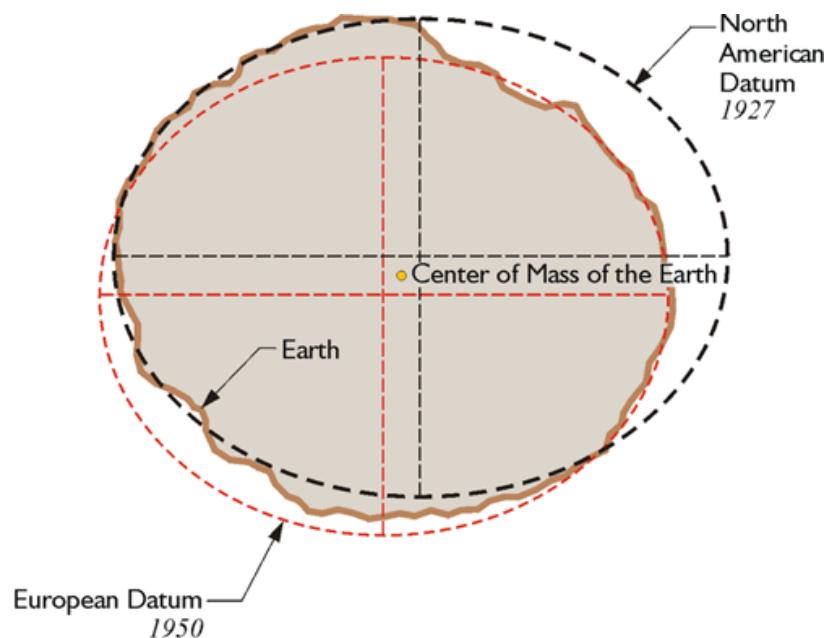

We can do the same for modeling Earth

- Problem 1:
 - How to decide the best ellipsoid?
 - i.e., how to select the parameters for the ellipsoid

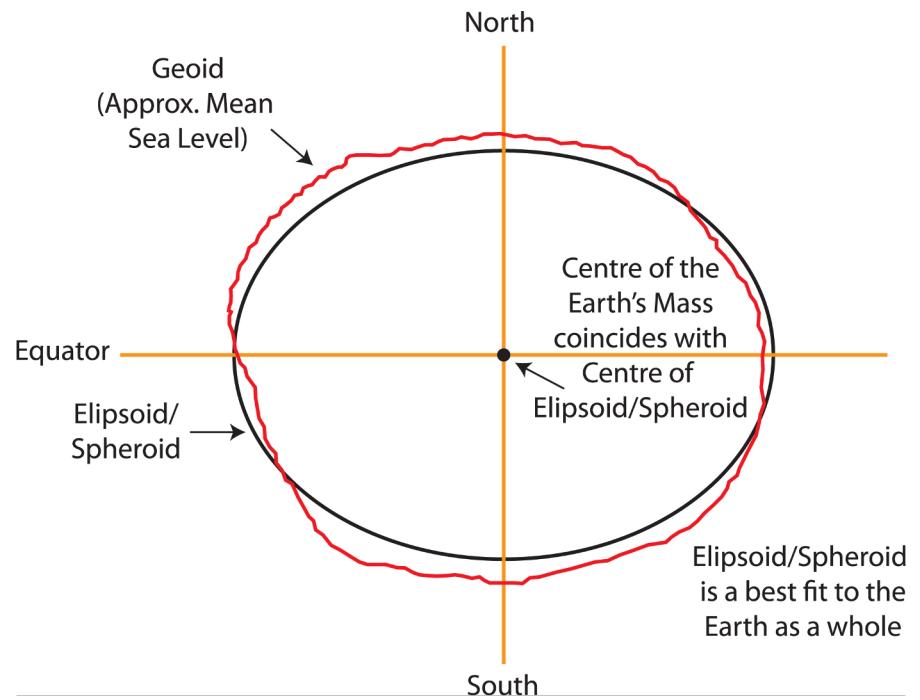

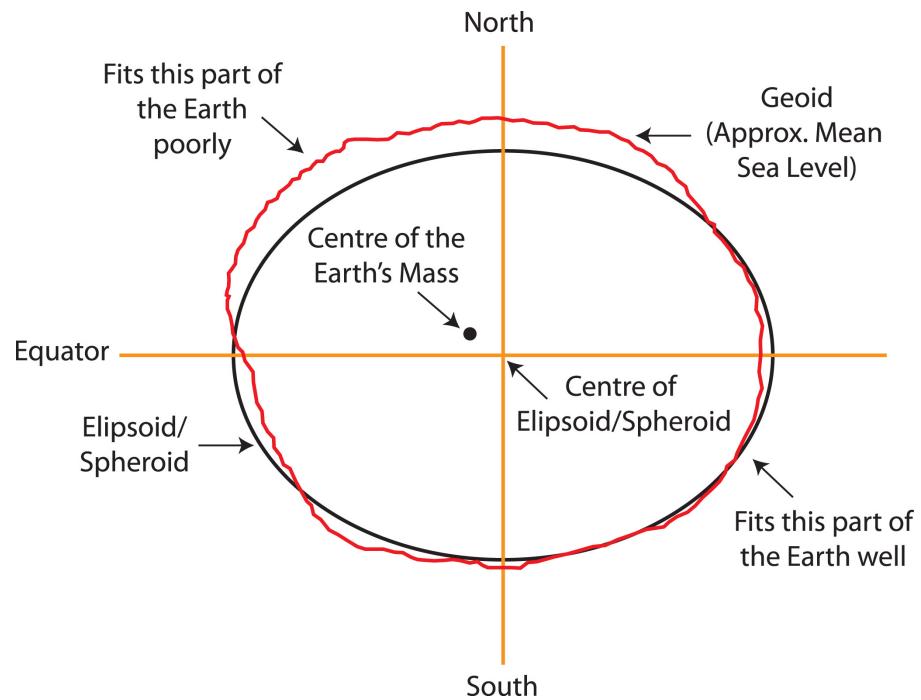

We can do the same for modeling Earth

- Problem 2:
 - How to align the ellipsoid to Earth?

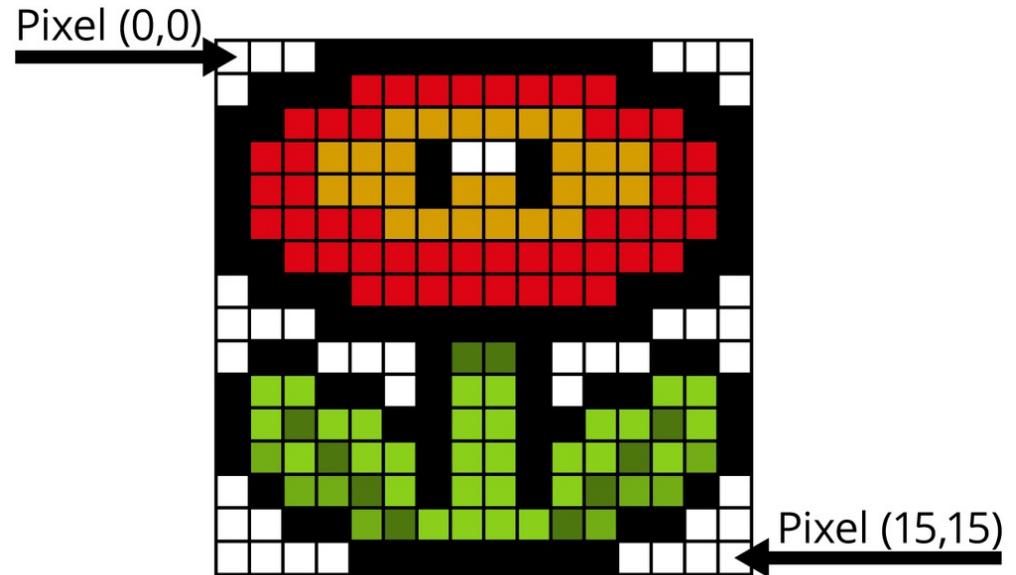

Datum

Spatial Reference Systems

- A standardized method for **assigning codes to locations** so that locations can be found using the codes alone.
- In a geospatial coordinate system, the x-direction value is the easting, and the y-direction value is the northing.
- “Most” systems make both values positive.

Geographic Coordinates

- Geographic coordinates are the Earth's latitude and longitude system
 - ranging from 90 degrees south to 90 degrees north in latitude and 180 degrees west to 180 degrees east in longitude

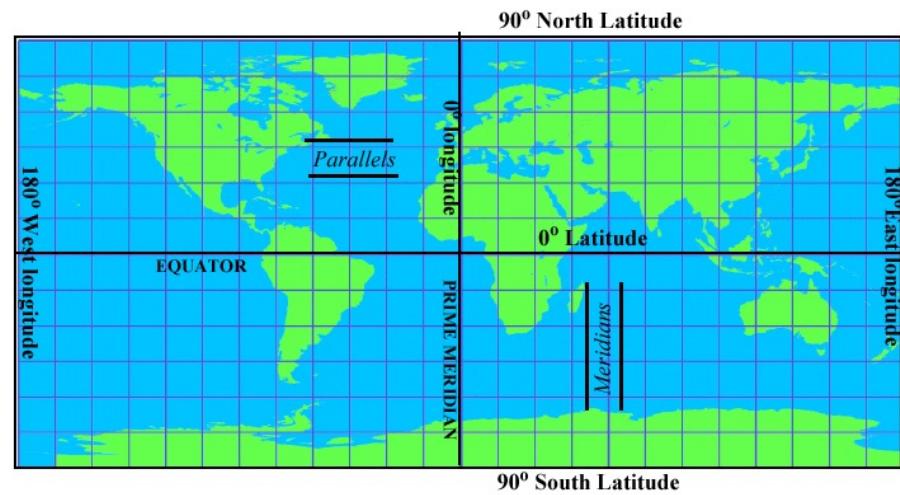

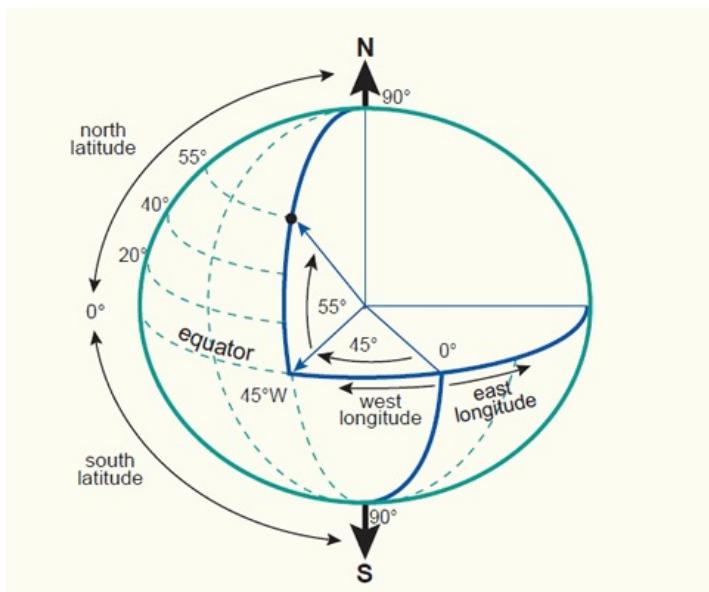

Figure 2.6 Geographic coordinates. The familiar latitude and longitude system, simply converting the angles at the earth's center to coordinates, gives the basic equirectangular projection. The map is twice as wide as high (360° east-west, 180° north-south).

Geographic Coordinates

Wait, how do we go from 3D ellipsoid to 2D maps?

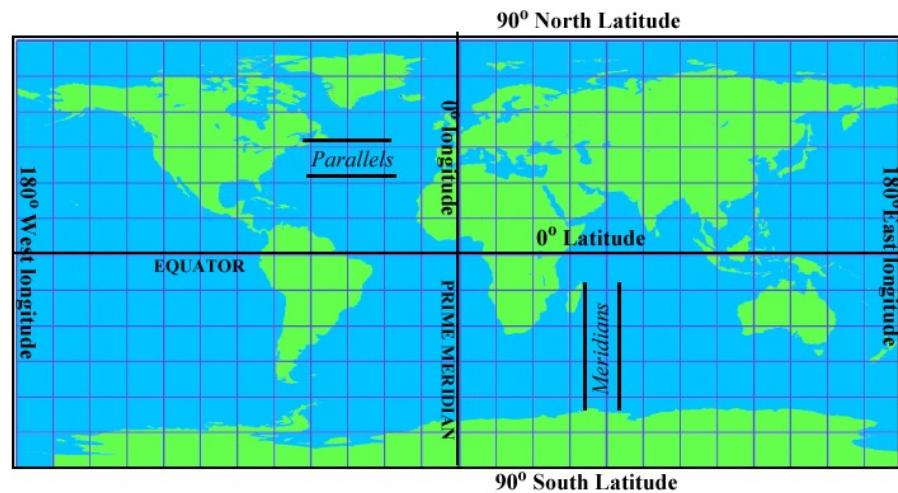

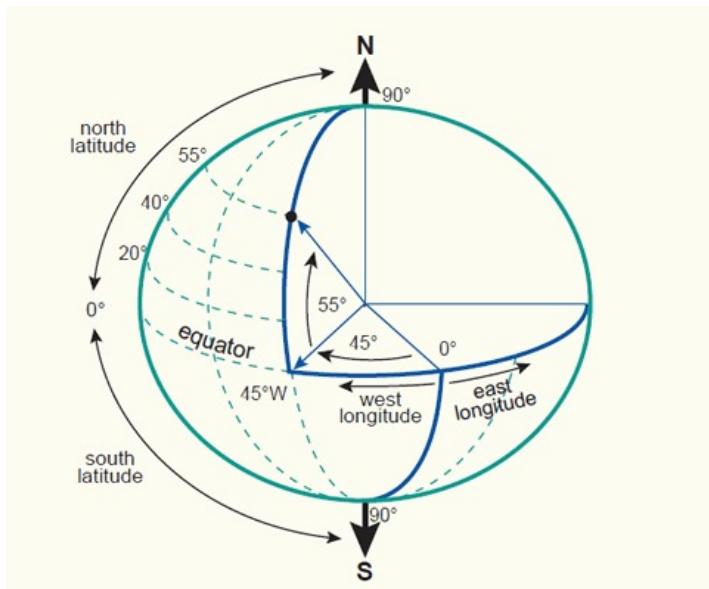

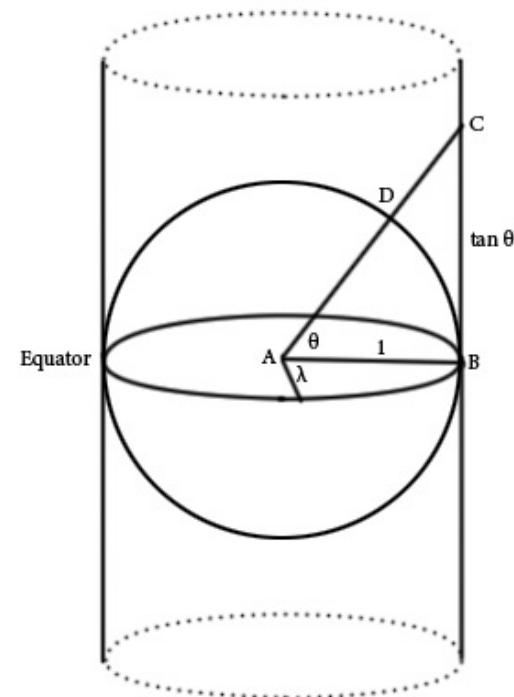

Figure 2.6 Geographic coordinates. The familiar latitude and longitude system, simply converting the angles at the earth's center to coordinates, gives the basic equirectangular projection. The map is twice as wide as high (360° east-west, 180° north-south).

Map Projections

- A mathematical transformation of the spherical or ellipsoidal Earth onto a flat map
- A projection that preserves the shape of features across the map is called conformal.
- A projection that preserves the area of a feature across the map is called equal area or equivalent.
- No flat map can be both equivalent and conformal. Most fall between the two as compromises.

Universal Transverse Mercator (UTM)

- Project a small piece of the 3D Earth to a 2D map
- Small grids help compute distances and directions easily

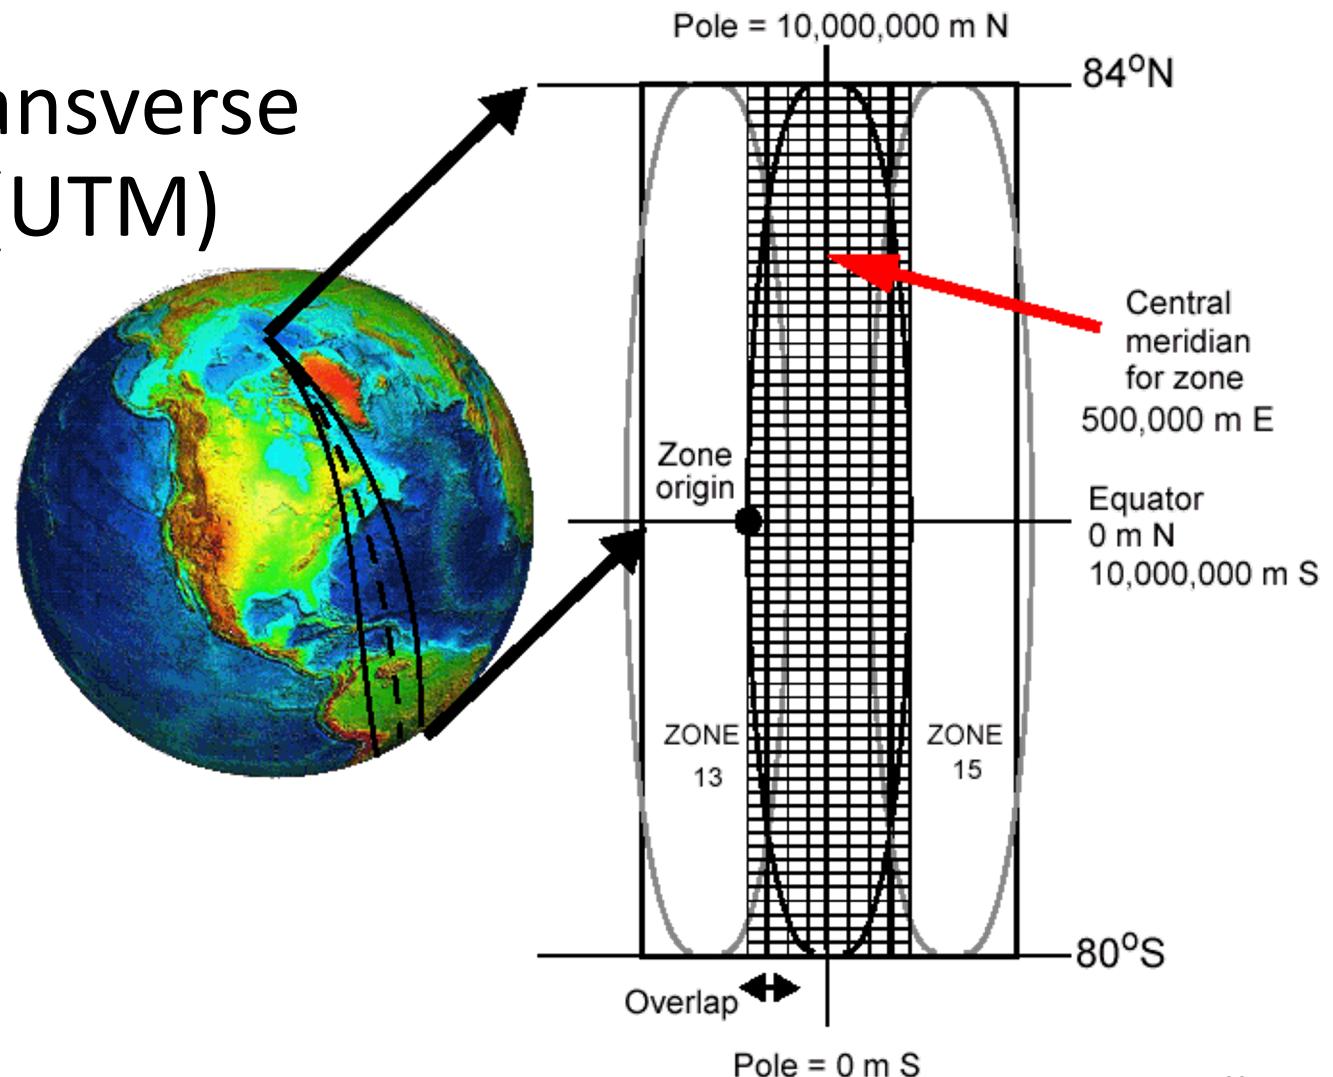

Figure 2.14 The universal transverse Mercator coordinate system.

Spatial Query Language

- Spatial data types, e.g., point, lines, polygon, ...
- Spatial operations, e.g., overlap, distance, nearest neighbor, ...
- Callable from a query language (e.g., SQL) of underlying DBMS

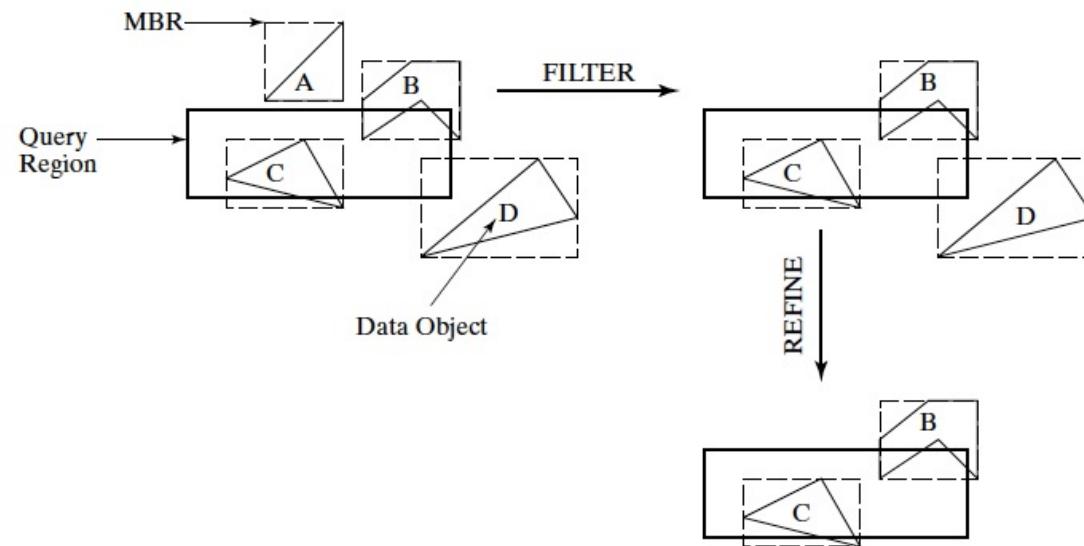

SELECT S.name

FROM Senator S

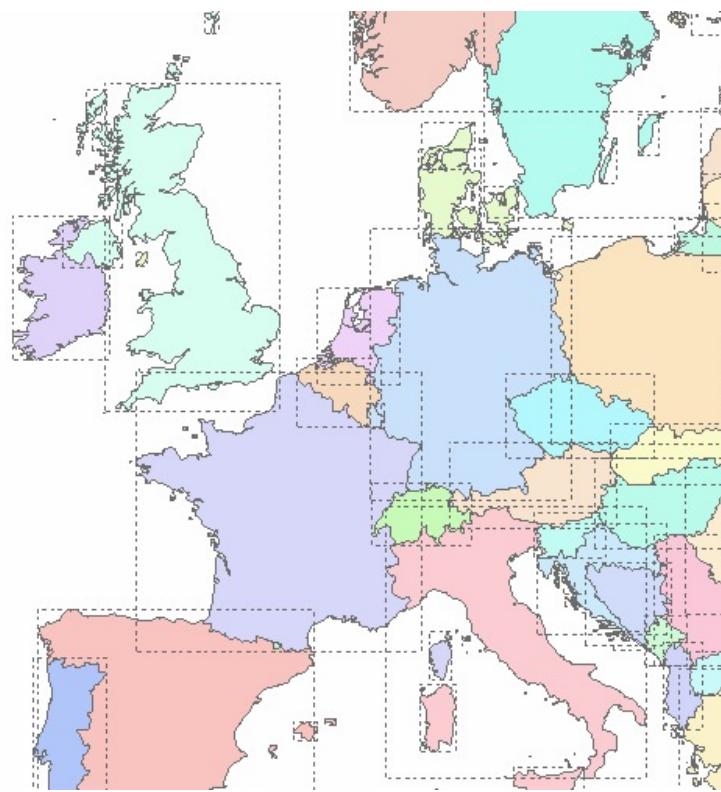

WHERE S.district.Area() > 300

Spatial Index and Query Processing

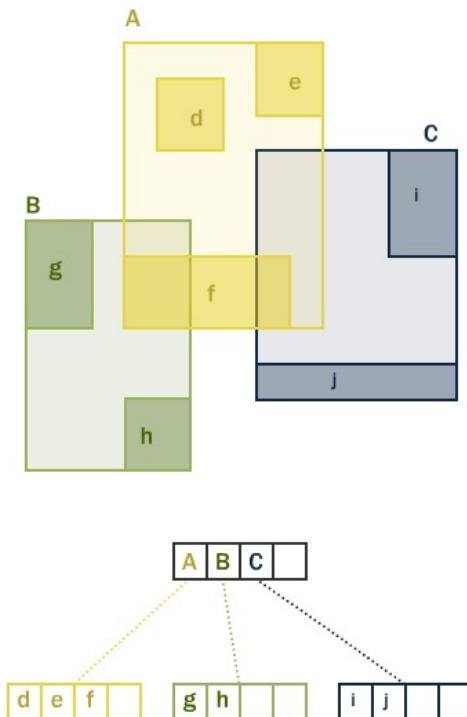

- Efficient algorithms to answer spatial queries
- Common Strategy - filter and refine
 - Filter Step: Query Region overlaps with MBRs of B,C and D
 - Refine Step: Query Region overlaps with B and C

Spatial Index and Query Processing – R-tree

R-tree Hierarchy

Example Queries

- Fundamental spatial algebra operations
 - Spatial selection: returning those objects satisfying a spatial predicate with the query object
 - “All cities in Bavaria”

SELECT sname FROM cities c WHERE c.center inside Bavaria.area
– “All rivers intersecting a query window”

SELECT * FROM rivers r WHERE r.route intersects Window
– “All big cities no more than 100 Kms from Hagen”

SELECT cname FROM cities c WHERE dist(c.center, Hagen.center) < 100 and c.pop > 500k

(conjunction with other predicates and query optimization)

Example Queries...*

- *Spatial join: A join which compares any two joined objects based on a predicate on their spatial attribute values*
 - “For each river pass through Bavaria, find all cities within less than 50 Km”

SELECT

r.rname, c cname, length(intersection(r.route, c.area))

FROM rivers r, cities c

WHERE r.route intersects Bavaria.area and

dist(r.route,c.area) < 50 Km

SFSQL Example

The screenshot shows the SFSQL Query Editor interface. The top pane displays a SQL script with code to create a table, insert data, and select from it. The bottom pane shows the resulting table data in a grid.

```
CREATE TABLE points (name varchar, point geometry);
INSERT INTO points VALUES ('Origin', 'POINT(0 0)'),
('North', 'POINT(0 1)'),
('East', 'POINT(1 0)'),
('West', 'POINT(-1 0)'),
('South', 'POINT(0 -1)');
SELECT name, ST_AsText(point) FROM points;
```

| | name | st_astext |
|---|--------|-------------|
| 1 | Origin | POINT(0 0) |
| 2 | North | POINT(0 1) |
| 3 | East | POINT(1 0) |
| 4 | West | POINT(-1 0) |
| 5 | South | POINT(0 -1) |

OK. Unix Ln 10 Col 1 Ch 258 5 rows. 941 ms

ST_Intersects

Intersects

ST_Intersects(geometry A, geometry B) returns t (TRUE) if the two shapes have any space in common, i.e., if their boundaries or interiors intersect.

Query with SRID in Mind

```
SELECT SUM(ST_Length(the_geom))
  FROM jacksonco_streets
 WHERE namelow = 'E Main St';
```

The screenshot shows a PostgreSQL query editor window titled "Query - medford on postgres@localhost:5432 *". The query entered is:

```
SELECT SUM(ST_Length(the_geom)) FROM jacksonco_streets
 WHERE namelow = 'E Main St';
```

The output pane displays the results of the query:

| sum | double precision |
|-----|------------------|
| 1 | 53281.0533406005 |

A text box overlaid on the output pane asks, "What is the unit here?".

At the bottom of the window, status information includes: OK., Unix, Ln 3 Col 1 Ch 91, 1 rows., 7701 ms.

The table “jacksonco_streets” has its SRID as 2270 (EPSG:2270: NAD83 / Oregon South (ft))

Query with SRID in Mind*

```
SELECT SUM(ST_Length(ST_Transform(the_geom, 2839)))
  FROM jacksonco_streets
 WHERE namelow = 'E Main St';
```

The screenshot shows a PostgreSQL query editor window titled "Query - medford on postgres@localhost:5432 *". The query entered is:

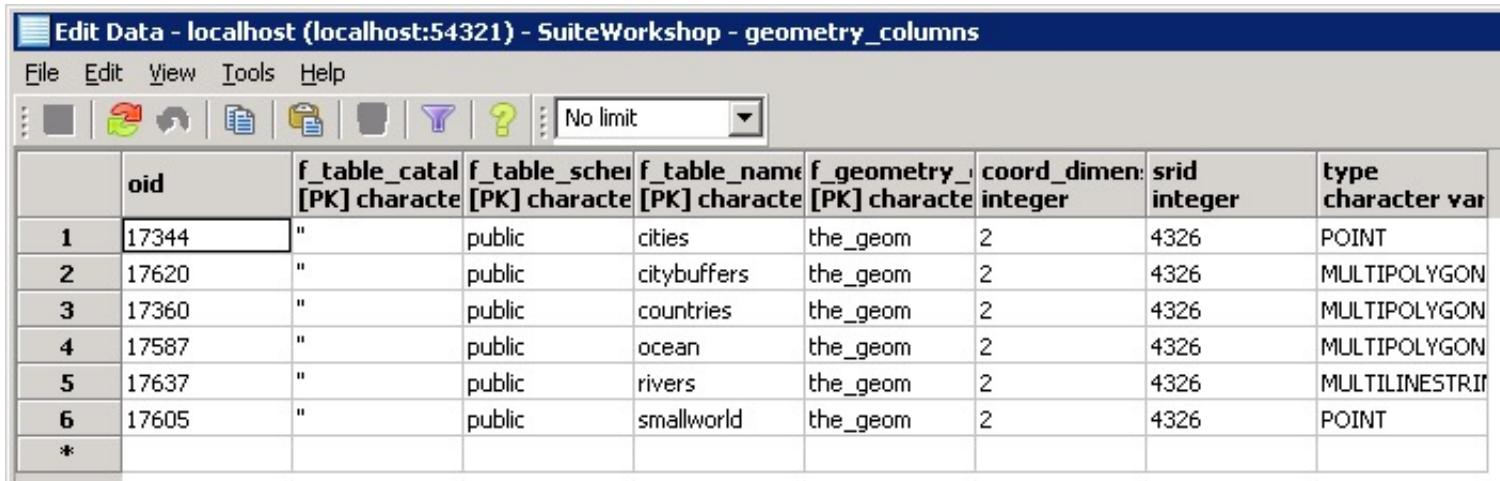

```
SELECT SUM(ST_Length(ST_Transform(the_geom, 2839)))
  FROM jacksonco_streets
 WHERE namelow = 'E Main St';
```

The output pane displays the results of the query:

| | sum |
|---|------------------|
| | double precision |
| 1 | 10144.0650582135 |

A callout box points to the value 10144.0650582135 in the result table with the text: "SRID 2389 is a metric projection so what is the unit here?".

Geometry Columns

The screenshot shows a database management interface titled "Edit Data - localhost (localhost:54321) - SuiteWorkshop - geometry_columns". The window includes a menu bar with File, Edit, View, Tools, and Help, and a toolbar with various icons. A search bar at the top right contains the text "No limit". Below is a table with the following data:

| | oid | f_table_catalog [PK] character varying | f_table_schema [PK] character varying | f_table_name [PK] character varying | f_geometry_column [PK] character varying | coord_dimension integer | srid integer | type character varying |
|---|-------|--|---------------------------------------|-------------------------------------|--|-------------------------|--------------|------------------------|
| 1 | 17344 | " | public | cities | the_geom | 2 | 4326 | POINT |
| 2 | 17620 | " | public | citybuffers | the_geom | 2 | 4326 | MULTIPOLYGON |
| 3 | 17360 | " | public | countries | the_geom | 2 | 4326 | MULTIPOLYGON |
| 4 | 17587 | " | public | ocean | the_geom | 2 | 4326 | MULTIPOLYGON |
| 5 | 17637 | " | public | rivers | the_geom | 2 | 4326 | MULTILINESTRING |
| 6 | 17605 | " | public | smallworld | the_geom | 2 | 4326 | POINT |
| * | | | | | | | | |

The geometry_columns view defines the dimension, geometry, and spatial reference system for each spatial table that contains a geometry type

Geometry Columns*

```
SELECT f_table_name, f_geometry_column, srid  
FROM geometry_columns;
```

The screenshot shows a PostgreSQL query tool window titled "Query - medford on postgres@localhost:5432 *". The query entered is:

```
SELECT f_table_name, f_geometry_column, srid  
FROM geometry_columns;
```

The results are displayed in a table titled "Output pane" under the "Data Output" tab. The table has three columns: f_table_name, f_geometry_column, and srid. The data is as follows:

| | f_table_name | f_geometry_column | srid |
|----|--------------------|-------------------|------|
| 1 | jacksonco_streets | the_geom | 2270 |
| 2 | tracts | the_geom | 2270 |
| 3 | jacksonco_schools | the_geom | 2270 |
| 4 | jacksonco_taxlots | the_geom | 2270 |
| 5 | medford_buildings | the_geom | 2270 |
| 6 | medford_citylimits | the_geom | 2270 |
| 7 | medford_hydro | the_geom | 2270 |
| 8 | medford_parks | the_geom | 2270 |
| 9 | medford_planzone | the_geom | 2270 |
| 10 | medford_stormdrain | the_geom | 2270 |

At the bottom of the window, status information includes "OK.", "Unix", "Ln 1 Col 3 Ch 3", "13 rows.", and "94 ms".

EPSG Geodetic Parameter Registry Version: 8.3.3
Welcome guest! | ([login](#) or [register](#)) | [help](#)

Welcome to the EPSG Geodetic Parameter Dataset

The EPSG Geodetic Parameter Dataset is a structured dataset of Coordinate Reference Systems and Coordinate Transformations, accessible through this data registry. The geographic coverage of the data is worldwide, but it is stressed that the dataset does not and cannot record all possible geodetic parameters in use around the world. The EPSG Geodetic Parameter Dataset is maintained by the Geodesy Subcommittee of OGP.

The EPSG Geodetic Parameter Dataset, offered through this OGP web registry service, may be used free of charge, but its use is subject to the acceptance of the [Terms of Use](#).

Users may query and view the data and generate printable reports. The Registry supports anonymous (guest) access, but also permits the user to register for additional services, such as the export of the entire dataset as GML 3.2 dictionaries.

Additionally the Registry provides a web service interface, permitting geospatial software to query and retrieve geodetic parameters. Information on how to access the service is available in [Guidance Note 7-3: EPSG Registry Developers Guide](#).

Every Geometry Column is associated with a Spatial Reference System

Geography VS Geometry

- The Geometry column type can hold geometric data of any type and in any (or no) projection and CRS.
 - not optimized for dealing with geodetic measurements (distances on the sphere)
- The Geography type, (while able to handle geodetic measurements), are much more limited
 - there are fewer compatible functions when compared to Geometry

Summary

- Effective spatial data management strategies can enable many spatial AI tasks
- SDBMS is a software module
 - works with an underlying DBMS
 - provides spatial ADTs callable from a query language
 - provides methods for efficient processing of spatial queries (e.g., using index)
- Components of SDBMS include
 - spatial data models, spatial data types, and operators
 - information about common spatial reference systems
 - spatial query language, processing, and optimization
- Always handle spatial data with reference systems in mind!

Spatial Data Can be Huge

- How to deal with large spatial data?
 - Next time - MapReduce

OpenStreetMap Data Extracts

The OpenStreetMap data files provided on this server do **not** contain the user names, user IDs and changeset IDs of the OSM contributors. [Extracts with full metadata](#) are available to OpenStreetMap contributors only.

Welcome to Geofabrik's free download server. This server has data extracts from the [OpenStreetMap project](#) which are normally offered by the OpenStreetMap project. This data download service is offered free of charge by Geofabrik GmbH.

Willkommen auf dem Geofabrik-Downloadserver. Hier gibt es Daten-Auszüge aus dem [OpenStreetMap-Projekt](#), die normalerweise kostenpflichtig sind. Bitte machen Sie sich mit den Daten vertraut, bevor Sie mit den Daten arbeiten.) Diese Downloads werden von der Geofabrik GmbH kostenlos angeboten.

Click on the region name to see the overview page for that region, or select one of the file extension links for quick access.

| Sub Region | Quick Links | | |
|-----------------------|----------------------|------------|------------|
| | .osm.pbf | .shp.zip | .osm.bz2 |
| Africa | [.osm.pbf] (4.9 GB) | ✗ | [.osm.bz2] |
| Antarctica | [.osm.pbf] (31.0 MB) | [.shp.zip] | [.osm.bz2] |
| Asia | [.osm.pbf] (10.4 GB) | ✗ | [.osm.bz2] |
| Australia and Oceania | [.osm.pbf] (945 MB) | ✗ | [.osm.bz2] |
| Central America | [.osm.pbf] (501 MB) | ✗ | [.osm.bz2] |
| Europe | [.osm.pbf] (24.5 GB) | ✗ | [.osm.bz2] |
| North America | [.osm.pbf] (11.1 GB) | ✗ | [.osm.bz2] |
| South America | [.osm.pbf] (2.7 GB) | ✗ | [.osm.bz2] |
